

1 **ABSTRACT OF THE DISCLOSURE**

2 A method of producing transfer stickers with metal powder has the steps of:
3 coating a substrate with a first isolating layer; coating the first isolating layer with a
4 resin layer; coating the resin layer with a metal powder layer by an electroplating
5 process; printing a first protecting resin layer pattern on the metal powder layer;
6 etching the metal powder layer for shape and to cause the patterns to protrude;
7 washing away the etching reagents; printing a second protecting resin layer on the
8 first protecting resin layer to protect the patterns in shape; printing an adhesive layer
9 on the second protecting resin layer; and then attaching a second isolating layer to the
10 adhesive layer. The transfer sticker made in accordance with this method has
11 exquisite patterns that can be transferred completely without other residual parts of
12 the sticker.
